

Exercise 4: Task 4

$$W_N = e^{j \frac{2\pi}{N}}$$

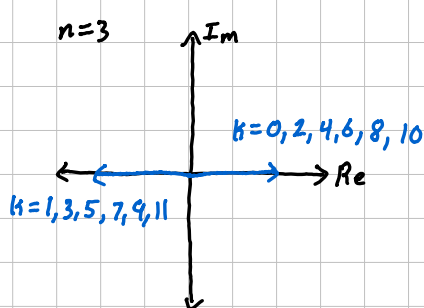

1) W_N^{nk} for $k = 0, 1, \dots, 11$

$$\begin{aligned} k=0 &: e^{j \frac{2\pi}{12}(1)(0)} = 1 \\ k=1 &: e^{j \frac{2\pi}{12}(1)(1)} = e^{j \frac{\pi}{6}} \\ k=2 &: e^{j \frac{2\pi}{12}(1)(2)} = e^{j \frac{\pi}{3}} \\ k=3 &: e^{j \frac{2\pi}{12}(1)(3)} = e^{j \frac{\pi}{2}} \\ k=4 &: e^{j \frac{2\pi}{12}(1)(4)} = e^{j \frac{2\pi}{3}} \\ k=5 &: e^{j \frac{2\pi}{12}(1)(5)} = e^{j \frac{5\pi}{6}} \\ k=6 &: e^{j \frac{2\pi}{12}(1)(6)} = e^{j \pi} = -1 \\ &\text{(repeats for } k=6, 7, \dots, 11) \end{aligned}$$

$$\begin{aligned} k=0 &: e^{j \frac{\pi}{6}(2)(0)} = 1 \\ k=1 &: e^{j \frac{\pi}{6}(2)(1)} = e^{j \frac{\pi}{3}} \\ k=2 &: e^{j \frac{\pi}{6}(2)(2)} = e^{j \frac{2\pi}{3}} \\ k=3 &: e^{j \frac{\pi}{6}(2)(3)} = e^{j \pi} = -1 \\ &\text{(repeats)} \end{aligned}$$

$$\begin{aligned} k=0 &: e^{j \frac{\pi}{4}(3)(0)} = 1 \\ k=1 &: e^{j \frac{\pi}{4}(3)(1)} = -j \\ k=2 &: e^{j \frac{\pi}{4}(3)(2)} = -1 \\ &\text{(repeats like this)} \end{aligned}$$

2) $W_N^{nk} = (e^{j \frac{2\pi}{N}})^{nk} = e^{j \frac{2\pi}{N} nk} = e^{j 2\pi k} = 1$

3) For n is divisible by N , $\frac{n}{N}$ is always an integer. This means $2\pi \frac{n}{N} k$ will always be an integer multiple of 2π , making $W_N^{nk} = 1$.

$$\sum_{k=0}^{N-1} W_N^{nk} = \sum_{k=0}^{N-1} e^{j 2\pi \frac{n}{N} k} = \sum_{k=0}^{N-1} 1 = N$$

For n is not divisible by N , the values of W_N^{nk} will rotate around the complex plane until they reach the $W_N^{nk}|_{k=N} = W_N^{nk}|_{k=0} = 1$. In this case, the imaginary and real components will sum to 0.

$$\sum_{k=0}^{N-1} W_N^{nk} = \sum_{k=0}^{N-1} \text{Re}\{W_N^{nk}\} + j \sum_{k=0}^{N-1} \text{Im}\{W_N^{nk}\} = 0$$

This can also be proven with the sum of a geometric series:

$$\sum_{k=0}^{N-1} e^{j 2\pi \frac{n}{N} k} = \frac{1 - e^{j 2\pi n}}{1 - e^{j 2\pi n/N}} = \frac{1 - 1}{1 - e^{j 2\pi n/N}} = 0$$

4) The Fourier modes in a DFT in \mathbb{R} are:

$$\psi_k(n) = e^{j 2\pi \frac{nk}{N}} = W_N^{nk}$$

In a DFT, $n \in \{0, 1, \dots, N-1\}$ so n will never be divisible by N .

$$\begin{aligned} \langle \psi_k(n), \psi_h^*(n) \rangle &= \langle W_N^{nk}, W_N^{nh*} \rangle \\ &= \sum_{n=0}^{N-1} e^{j 2\pi \frac{nk}{N}} e^{-j 2\pi \frac{nh}{N}} \\ &= \sum_{n=0}^{N-1} e^{j 2\pi \frac{n}{N} (k-h)} \\ &= 0, \quad \text{s.t. } k \neq h \end{aligned}$$

The Fourier modes are orthogonal because $\langle \psi_k(n), \psi_h^*(n) \rangle = 0$
